

NEW Smart Cleaner

For Practices That Want to Remove Handpiece Water Blockages Immediately

Handpieces can have water blockages for many reasons including micro sized pieces of compound breaking off coupling O-rings.

Handpiece Hotline Smart Cleaner® is a unique injector for cleaning blockages in turbines and couplings through the use of a helical pushing movement of an injector piston.

Handpiece Hotline Smart Cleaner® serves two purposes:

- 1.** Removal of blockages caused by micro particles carried in the water supply and inert biofilm residue left in the turbine
- 2.** Prevention of initial residue/particle buildup by using Smart Cleaner® with hot water every two days

Blockage Removal Instructions:

- a.** Fit the connector of the Smart Cleaner® to the turbine or coupling
- b.** Undo Smart Cleaner® threaded handle
- c.** Remove the piston
- d.** Half fill Smart Cleaner® with hot water
- e.** Return the piston to Smart Cleaner® and push it in with normal hand pressure
- f.** If not successful or resistance is too great for normal hand pressure, fit the threaded handle and screw it down to the stop
